

There are several ways to attach a hemispherical parachute to your rocket. All of our chutes have long lines to give you many options for attaching. One easy way to do this is to tie pairs of line together using an overhand knot about a foot from the end (see fig 1 and 2). Then cut one of the lines after the knot so that each pair of lines is grouped into one line. Then, tie the lines together in pairs again (see fig. 3). You can then attach this directly to the rocket, or attach it via a quick link.
